Bovine Tuberculosis Eradication Program Quarterly Update
Provided by the Animal Industry Division
Michigan Department of Agriculture and Rural Development (MDARD)

Act No. 252 Public Acts of 2014, Approved by the Governor June 30, 2014, Filed with the Secretary of State June 30, 2014, EFFECTIVE DATE: June 30, 2014.

AN ACT to make appropriations ...

Sec. 457. On or before October 15, 2008, and on a quarterly basis thereafter, the department shall report to the senate and house agriculture committees, the senate and house appropriations subcommittees on agriculture, and the senate and house fiscal agencies on the department's progress toward meeting USDA requirements as outlined in the March 2007 bovine TB program review. The report shall include, but is not limited to, information and data on: wildlife risk mitigation plan implementation in the modified accredited zone; implementation of a movement certificate process; progress toward annual surveillance test requirements set out in the June 2007 MOU; compliance efforts and rates for animals crossing the Mackinac Bridge; efforts to work with slaughter facilities in Michigan, as well as those that slaughter a significant number of animals from Michigan; educational programs and information for Michigan's livestock community; any other item the legislature should be aware of that will promote or hinder efforts to achieve bovine TB-free status for Michigan.

A. MDARD Bovine Tuberculosis Eradication Program Activities

Why We Do What We Do

Michigan's citizens are protected from exposure to the bovine tuberculosis (TB) organism as a result of the Bovine TB Eradication Program. The Michigan Bovine TB Program was established under Public Act 466, of 1988, as amended, the Animal Industry Act, and is required under Federal Law in order for Michigan producers to participate in interstate commerce of animals (9CFR Part 77) and to maintain a state status (9CFR Part 92). Bovine TB has economic and human health implications and the program is of high visibility and interest to farmers, producer groups, hunters, and the federal government. The disease is of high interest at the national level, and other states would close their markets to Michigan cattle, meat, and milk products if the program were reduced or eliminated. More than 13,600 cattle producers in Michigan maintain over 1.1 million cattle each year. The Michigan program prevents farm to farm transmission of bovine TB and provides access to national and international markets. The 74 dairy producers located within the Modified Accredited Zone (MAZ) may sell Grade A milk because their herds are TB tested annually.

Trace Testing

46 of 47 trace investigations relating to the 61st TB affected herd have been completed. 15 of these herds, with 2,400 cattle, required TB testing. There was no further finding of disease in any of these trace herds.

The source herd for the 62nd affected herd was tested and no disease discovered. There were no exposed traces from this farm

Circle Testing in Presque Isle County

As a result of discovering two TB infected free-ranging white-tailed deer in Presque Isle County, two potential high-risk areas were established on February 9, 2015. To date, 59 Presque Isle herds with 1,360 head of cattle have been TB tested with no disease found in the tested herds. An additional three herds have herd plans to test during the next two months.

B. MDARD Bovine Tuberculosis Surveillance

On October 13, 2014, the new zoning order went into effect and recognizes the counties of Antrim, Charlevoix, Cheboygan, Crawford, Emmet, Otsego, and Presque Isle as Accredited TB Free. At present, 79 of Michigan's 83 counties (95%) have moved to TB Free status.

The main change to the new zoning order relates to surveillance testing in Antrim, Charlevoix, Cheboygan, Crawford, Emmet, Otsego, and Presque Isle counties:

- 55 herds are randomly picked annually to TB test from Antrim, Charlevoix, Cheboygan, Emmet, and Otsego Counties combined
- 61 Presque Isle County herds are randomly picked annually to TB test
- No further surveillance TB testing is occurring in Crawford County

So far in 2015, 278 whole herd tests have been completed in the MAZ and 112 whole herd tests have been completed in the TB Free Zone.

C. Bovine Tuberculosis Affected Herds

Update of Infected Herd #61

On March 30, 2015, a dairy herd in Alpena County, in Michigan's Modified Accredited Zone, had 39 animals that responded to TB testing. Those 39 animals were removed from the premises for confirmatory testing at the Michigan State University Diagnostic Center for Population and Animal Health (DCPAH) and 32 of the 39 animals had lesions consistent with bovine TB. The herd was designated as affected by bovine TB on April 22, 2015. A second test of all animals in the herd was done in May and an additional 35 animals responded to the second test including many that were negative on the first test. The herd owners requested to depopulate the herd. The request to depopulate was approved by USDA on September 9, 2015. The appraisal process is underway and the TB Program is anticipating having the farm completely depopulated, and cleaned and disinfected by the end of November 2015. TB Program staff also did a considerable amount of work over the summer with the owners of the farm to upgrade the farm's biosecurity plan.

Update of Infected Herd #62

On May 19, 2015, a small beef herd in Alcona County, in Michigan's Modified Accredited Zone, had two animals that responded to TB testing. Both animals were removed from the farm July 15, 2015, for confirmatory testing at DCPAH and both animals had lesions consistent with bovine TB. The herd was designated as affected July 22, 2015. The decision was made to depopulate this herd. The remaining six cattle, two goats, and two pigs were removed from the farm on July 26, 2015. One of the cows and one of the goats were found to have lesions consistent with bovine TB. The TB Program is working with the owner to clean and disinfect the premises.

D. Wildlife Risk Mitigation Project

The Wildlife Risk Mitigation Project began in 2008 with a goal to enroll commercial farms. MDARD asked that these farmers adopt biosecurity practices that reduce the risk of cattle coming into direct or indirect contact with bovine tuberculosis infected free-ranging white-tailed deer. Farmers in Northern Lower Michigan whose cattle have been identified as at risk for bovine TB transmission from wildlife are using the following steps to prevent disease transmission and to market their cattle:

- Fence in feed – and keep the fences closed
- Store feed in buildings
- Feed cattle away from deer cover
- Feed cattle daily
- Provide water to cattle where it cannot be contaminated by deer
- Use disease control permits from DNR to keep deer numbers down on cattle farms

Presently, 788 of the 852 active commercial farms in the TB surveillance zone (92.49%) have a verified Wildlife Risk Mitigation Action Plan in place.

E. Communications/Outreach

News Release:

Announcement of 62st TB Affected herd - July 23, 2015

Outreach:

Alcona County Public Meeting

On August 6, 2015, a public meeting was held in Barton City, Michigan where TB Program staff discussed the 62nd TB affected herd as well as the progress that has been made with bovine TB in recent years, at both the state level, and in Alcona County.
